Figure 1. The effect of the concentration of the inhibitor on the rate of polymerization of α -methylstyrene in the presence of Cu^{2+} ions. The reaction conditions were: $[\text{M}] = 0.05 \text{ mol/L}$, $[\text{Cu}^{2+}] = 0.001 \text{ mol/L}$, $[\text{KBrO}_3] = 0.001 \text{ mol/L}$, $[\text{KBr}] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{SO}_4] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}_2] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}_2] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}_2] = 0.001 \text{ mol/L}$, $[\text{H}_2\text{O}] = 0.001 \text{ mol/L}$.

Abstract—The purpose of this study was to determine whether there were differences in the prevalence of musculoskeletal disorders among different types of workers. The subjects included all employees of a large manufacturing company who had been employed for at least one year. A questionnaire was sent to each employee asking about his or her work history, symptoms of musculoskeletal disorders, and other factors. The results showed that the prevalence of musculoskeletal disorders was higher among workers in certain job categories than among others. These findings suggest that there may be specific risk factors associated with certain types of work.

Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The subjects included all employees of a large manufacturing company who had been employed at least one year. A questionnaire was sent to each employee asking about symptoms of musculoskeletal disorders and work-related factors. The results showed that the prevalence of musculoskeletal disorders was higher among non-manual workers than manual workers. This result may be due to the fact that non-manual workers have more varied tasks and are exposed to more physical demands than manual workers.
